

NOW is the time to improve your oral health

Comprehensive dentistry can save your teeth, improve your smile, and keep you looking great. However, problems must be caught early and treated promptly. A single or combination of previous bad dental experiences can add up to a real fear of dental treatment. IV Sedation can get you back to wonderfully healthy, attractive, and pain-free teeth. Teeth that will serve you a lifetime. Let us work together to give you the opportunity to get the dentistry you need without the fear of the treatment. You will find the staff understanding, with regard for your special concerns when you call. They have treated many patients like yourself.

Dentistry today can be a pleasant experience especially with intravenous sedation.

NOW is the time to take advantage of the most advanced sedative technique in dentistry... before you have problems that will change your lifestyle.

You only need to make one call....

What is INTRAVENOUS SEDATION?

IV Sedation is a state-of-the-art technique for the comprehensive control of pain and anxiety in dentistry. There are other methods used in dentistry such as oral (pill) sedation but IV Sedation's **superior** results make it the method of choice for the highly fearful dental patient. Because of the types of medications used and their instant delivery, IV Sedation allows the dentist to control their effects precisely. Patients who receive conscious sedation usually are able to speak and respond to verbal cues throughout the procedure, communicating any discomfort they experience to the dentist. A brief period of amnesia will typically erase any memory of the procedure.

WHEN is Intravenous Sedation administered?

Conscious sedation is administered in Dr. Cabianca's office to facilitate the following procedures and circumstances:

- Nervous/anxious patients requiring dental work
- Dental Implant therapy
- Sinus Augmentation/grafting
- Orthopaedic block grafting
- Wisdom teeth removal
- Gag reflex
- Difficulty becoming numb

WHO CAN ADMINISTER Intravenous Sedation?

Intravenous sedation is extremely safe when administered by qualified providers. The use of IV Sedation in dentistry is carefully regulated by the British Columbia College of Dental Surgeons. To perform these advanced sedative techniques special training and clinical experience is required. In addition to training in sedation techniques Dr. Cabianca is also trained in Advanced Cardiac Life Support (ACLS) from the American Heart Association. Approval to perform IV Sedation requires the office to be specially equipped with emergency equipment and medications. This includes an ECG monitor to observe your heart rate, rhythm and breathing. The office contains more emergency equipment and drugs than required by law and the staff constantly trains to provide the highest level of sedation care.

HOW will I **FEEL**?

You will feel comfortable at all times. You will be in a deep and relaxed state but will be responsive to verbal commands. Patients often comment that they were **asleep** throughout the procedure. You will be given a local anaesthetic for the work in your mouth **after** the sedative is administered.

Following your treatment, it is unlikely you will remember the actual dental procedures. You will be groggy and unsteady and therefore **MUST** have a responsible ADULT (18+ years of age) escort you home. Patients should not drive a vehicle, operate dangerous equipment or make any important decisions for at least 24 hours after receiving intravenous sedation. A follow-up phone call is usually made to check on the patient's condition and answer any questions.
